Baunsgaard et al. 2016		<p><b>Intra-rater</b></p> <p>Kappa weighted: 0.81 (Hip right flexors)</p> <p>Simple Kappa: 0.38 (Hip)</p> <p><b>Inter-rater</b></p> <p>Kappa weighted: 0.54 (Hip right flexors)</p> <p>Simple Kappa: 0.17 (Hip right flexors)</p>
Lee et al. 1989	No data available	<p>With 4 raters: Kendall 0.92</p> <p>Avg. Spearman rank correlation of 0.89 with 95% CI (7.5-1.0)</p> <p>7.2-9.4 intra-rater variability (coefficient of repeatability) with a coefficient of variation 5.4-7.7%</p>
Haas et al 1996	No data available	<p>Mean Kappa values:</p> <p>Original=0.41</p> <p>Adductor=0.61 to Plantarflexor=0.21</p> <p>Modified=0.34</p> <p>Adductor=0.62 to Plantarflexor=0.20</p>
Smith et al 2002	No data available	<p>Mean Kappa values</p> <p>MAS=0.14-0.35</p> <p>Mean ICC for V-MAS = 0.59-0.88</p> <p>Spearman's correlation coefficient=0.73</p>
Tederko et al 2007	No data available	<p>Mean ICC for MAS = 0.56 (adequate reliability, averaged from scores from age, sex, neurological status, site of injury, functional status, pharmacotherapy for spasticity, rating by specialist, rating by resident)</p>
Craven & Morris 2010	No data available	<p>For Rater A, the intra-rater reliability for lower extremity MAS was substantial to high (<math>0.6 &lt; k &lt; 1.0</math>) for three of six muscle groups. Muscle groups with poor reliability were the knee extensor, ankle plantarflexor and dorsiflexor muscle groups.</p> <p>For rater B, reliability varied between sessions:</p> <ul style="list-style-type: none"> <li>- in session 1, reliability was poor-to-fair (<math>k &lt; 0.4</math>), except for ankle plantarflexors and contrarily were substantial-to-high (<math>0.6 &lt; k &lt; 1.0</math>) for session 5 for all except knee quadriceps and hamstrings</li> </ul> <p>Inter-session reliability was fair-to-good (<math>0.4 &lt; ICC &lt; 0.75</math>) for all muscle groups.</p> <p>The ICC for the knee flexors, knee extensors and adductors were lower (<math>0.4 &lt; ICC &lt; 0.4</math>) than the ankle plantarflexors (<math>ICC = 0.75</math>). These results indicate that lower extremity MAS score reliability is much lower than the clinically desired value (<math>ICC &gt; 0.75</math>) for all but one muscle group (Right knee hamstrings).</p> <p>Inter-rater reliability was poor-to-moderate (<math>k &lt; 0.6</math>) for all muscle groups except the hip adductors. The agreement between the two raters was inconsistent across muscle groups and sessions and much lower than the desired Kappa (<math>k &gt; 0.81</math>)</p>

Commented [VN1]: In the paper there are values for other body parts (e.g. knee and ankle). What was the reasoning for not including these?

<b>2. VALIDITY</b>																														
<b>Author ID</b>	<b>Validity</b>																													
Sherwood et al 1998	There was a significant difference between average sEMG scores for those with average Ashworth 0 vs 2&3, and 1 vs 2&3 (P<0.001) but not between 0 and 1. However, when assessing individual muscles, the sEMG is more discriminatory.																													
Skold et al 1998	64 (80%) of EMG measures correlated significantly with MAS (P<.05). However, when subjects scoring 0 were removed from the analysis, only 25% of correlations were significant suggestive of an end-of-range effect.																													
Smith et al 2002	Spearman r between MAS and PT= -0.69 (no 95% CI) V-MAS and PT=0.83 (95% CI=0.73-0.89)

<b>3. RESPONSIVENESS</b>						
<b>Author ID</b>	<b>Responsiveness</b>					
Penn et al. 1989	IT Baclofen, Ashworth was reduced from 4.0±1.0 to 1.2 ±0.4 (P<.0001), concomitant decrease in spasm frequency 3.3 ±1.2 to 0.4± 0.8 (P<.0005). After mean follow-up of 19.2months, Ashworth was 1.0± 0.1 and SFS (Spasm Frequency Scale) was 0.3± 0.6.					
Gianino et al. 1998	IT Baclofen, mean Ashworth decreased from 3.78 to 1.48 in one year (P=.0000014), concomitant decreases in spasm scores from 2.6 to 0.5 over 1 year. (P=.000017).					
Aydin et al. 2005	Baclofen (n=10) Pre-post Spasm Frequency Score (SFS) and Lower Limb Ashworth Score (LLAS) were -28±30 and -28±22, respectively. TENS (transcutaneous electrical nerve stimulation) (n=11) pre-post SFS and LLAS was -16±16 and -17±17, respectively. All other spasticity related measures progressed in the same direction also.					
Boviatsis et al. 2005	From pre-tx to final post-tx, Ashworth decreased from 4.57 to 2.57 (P=.0134). Concomitant reduction in spasm scores from 3.71 to 1.27 (P=.00006).
