Depression Anxiety Stress Scale - 21 (DASS-21)

Assessment Overview

Assessment Area

ICF Domain:

Body Function

Subcategory:

Mental Functions

Subscales:

Depression, anxiety, stress (7 items each)

You Will Need

Length:

10 minutes, 21 items

Scoring:

Items scored 0-3. Subscale scores are the sums of respective items multiplied by 2. Higher score represents greater distress

Training:

None, but training in psychological sciences and reading the manual is helpful.

Summary

The Depression Anxiety Stress Scale-21 (DASS-21) is a screening tool for identifying, differentiating and assessing depression, anxiety, and stress. The DASS-21 is the short form of the DASS-42 (or DASS).

The DASS-21 contains 21 items, divided into three 7-item subscales, where each item is a statement referring to the past week.

Availability

Worksheet: Can be found here.

Languages: English, Portuguese, Arabic and Cantonese

Assessment Interpretability

Minimal Clinically Important <u>Difference</u>

Typical Values

Mean (SD) Scores:

Depression subscale: 7.8 (9.33) Anxiety subscale: 6.4 (5.87) Stress subscale: 10.4 (10.00)

(Mitchell et al. 2008; n=40, 30 males, 10 females; 26 paraplegia, 14 tetraplegia; mean time since injury: 113.9 months)

Threshold Values:

Not established in SCI; but for the general population, scores for normal/mild/moderate/severe/ extremely severe defined as: Depression:

0-9/10-13/14-20/21-27/28-42 Anxiety:

0-7/8-9/10-14/15-19/20-42

Stress:

0-14/15-18/19-25/26-33/34-42

(Lovibond & Lovibond 1995b; Manual for the Depression Anxiety & Stress Scales. (2nd Ed.))

Normative Data:

Available from the manual, which must be purchased

Measurement Properties

Validity - Moderate to High

High correlation between DASS-21 Depression subscale and Brief Symptom Inventory (BSI) Depression scale:

r = 0.70

High correlation between DASS-21 Anxiety subscale and BSI Anxiety scale:

r = 0.61

(Mitchell et al. 2008; n=40, 30 males, 10 females; 26 paraplegia, 14 tetraplegia; mean time since injury: 113.9 months)

Moderate to High inverse correlation with Moorong Self-Efficacy Scale (MSES):

Depression scale: r = -0.63

Anxiety scale: r = - 0.54

Stress scale: r = -0.58

(Kilic et al. 2013; n=60; 41 males, 19 females; 41 incomplete, 18 complete;

mean time since injury (SD): 5.7 (7.3) years)

Number of studies reporting validity data: 2

Reliability - Not stablished

Not established in SCI

Number of studies reporting reliability data: 0

Responsiveness

Floor/Ceiling Effect: Not established in SCI Effect Size:
