In contrast to the participants with paraplegia, there was no significant difference between HC and non-HC during rehabilitation for participants with tetraplegia. 6. In the post-rehabilitation period, there was no significant difference between HC and non-HC groups.</p>
<p>Nooijen et al. 2015 Netherlands Pre-Post Level 4 N=30</p>	<p>Population: 30 SCI individuals, 20 paraplegia, 10 tetraplegia, 12 incomplete lesion, 18 complete lesion Treatment: Structured hand cycle interval training program during the last 8 weeks of inpatient rehab. Training was more than 2 times per week at intended intensity of Borg score of 4 to 7 on a 10-point scale. Outcome Measures: Peak power output and VO₂peak</p>	<p>1. Peak power output and VO₂ peak improved significantly after the training period.</p>
<p>Hubli et al. 2014 Canada Cross-sectional Level 5 N=20</p>	<p>Population: 20 individuals with motor-complete chronic SCI (C2-T5, 2-29 years post-injury, AIS-A or B). 10 of these individuals were elite hand-cyclists and 10 were sex matched to sedentary individuals with SCI. Treatment: None Outcome measures: Aortic Pulse Wave Velocity (PWV), discrete brachial blood pressure, heart rate</p>	<p>1. No differences in systolic blood pressure, diastolic blood pressure, mean arterial pressure, and heart rate when resting supine between athletes and non-athletes. 2. Aortic PWV was significantly lower in athletes compared with non-athletes.</p>

Note: AIS = ASIA Impairment Scale; BP = blood pressure; d = day; hr = hour; HR = heart rate; HRR = heart rate reserve; min = minute; RCT = randomized controlled trial; RPE = rating of perceived exertion; SCI = spinal cord injury; wk = week; yrs = year.
