<p>Cramp et al. 2014 Canada Observational Study Level 5 N=7</p>	<p>Population: 7 women (age range= 24-61 years); AIS A-D, level of injury C5-L3.</p> <p>Methodology: Each participant completed an in-depth interview (average 85mins).</p> <p>Outcome Measures: 13 themes regarding sexuality, 10 themes regarding urinary incontinence (UI) on sexuality.</p>	<ol style="list-style-type: none"> 1. Themes regarding sexuality: fear of rejection, fear that their partners would leave them for able bodied women, fear of being hurt, disappointment to assume a more passive role during sex due to loss of mobility, more planning required, need to “fake orgasm” to please their partners. 2. Themes regarding the impact of urinary incontinence on sexuality: fear UI during sexual activity, fear of darker/odorous urine during bladder infection, preparations involving a pee pad, causes some women to withdraw from sexual activities. 3. Intimacy and the sexual experience were negatively affected by UI as a result of SCI, and by an excessive concern about autonomic dysreflexia.
