<p>Cowley 2007 Canada Case report Level 5 N = 1</p>	<p>Population: One mother (n = 1) with C8 tetraplegia (AIS unknown). Treatment: Modifications and equipment to facilitate aspects of caring for an infant. Outcome measures: Physical independence in caring for infant</p>	<ol style="list-style-type: none"> 1. No description of the mother's particular breastfeeding/lactation experience or whether or not lactation dysfunction occurred. 2. Aids described were generally for mobility rather than for lactation/breastfeeding itself (e.g., placing a couch beside the crib allowed mother to transfer from her wheelchair to the couch and place infant in the crib immediately after feeding). 3. Attachment arms and brackets were made so that a lightweight stroller could be attached directly to the mother's manual wheelchair. 4. A crib was modified with sliding Lexan doors so that it could be accessed at wheelchair level. 5. A table with sides was designed and built to act as a play surface where the mother could independently place an infant. 6. With the exception of bathing, using the tools and techniques described, this mother was able to achieve physical independence in providing her children's infant care.
