

Author Year Country Research Design Sample Size	Methods	Outcome
<p>Banks & Ho 2008 USA Pre-post N=3</p>	<p>Population: Mean age=61 yr; Gender: males; Level of injury: C7, T12, T10; Severity of injury: AIS A.</p> <p>Treatment: SCI patients with stage IV pressure injuries in their pelvic region were treated with EpiFLO device (extracts oxygen from air, concentrates to near 100% and delivers oxygen via cannula to saturate wound) daily during rehabilitation.</p> <p>Outcome Measures: Wounds linear measure and volume.</p>	<ol style="list-style-type: none"> 1. First patient linearly had 49% improvement 9 wk post treatment; pre-treatment the patient's wound measured 20.5cm linearly and volume was 252cm³, while 9 wk later, the linear measure reduced to 10.2cm linearly with a volume of 24 cm³. 2. The second patient's wound reduced from 10.5 cm linearly to 5.5cm after 5 wk treatment and volume decreased from 30cm³ to 4 cm³, linearly this was a 48% improvement from baseline. 3. The last patient's wound decreased by 31% from baseline after 5 wk treatment.
