<p>Russell et al. 2021</p> <p>Retrospective study using ROC analyses and odds ratios to identify the clinical utility of the ADAPSS-sf. In addition, blocked hierarchical regression explored the ADAPSS-sf predictive characteristics for satisfaction with life beyond measures of emotional distress</p>	<p>Study participants were categorized into either “healthy adjustment” (n = 53) or “poor adjustment” (n = 37).</p> <p>Healthy adjustment: N = 53 Mean (SD) age 55.4 (13.3) years 50M, 3F Injury characteristics: Tetraplegia (AIS A, B, C) (n = 14), paraplegia (AIS A, B, C) (n = 25), AIS D (n = 14) Traumatic injury: Yes (n = 45), no (n = 8)</p> <p>Poor adjustment: N = 37 Mean (SD) age 55.7 (12.9) years 36M, 1F Injury characteristics:</p>			<p>The ADAPSS-sf is effective in identification of poor psychological adjustment, $P < .001$.</p> <p>Diagnostic odds ratios and ADAPSS-sf cut scores were selected to prioritize sensitivity ($7.17, \leq 11$), specificity ($68.25, \geq 22$), or a balance of the two ($16.32, \leq 19$).</p> <p>Hierarchical regression indicated the ADAPSS-sf accounted for unique variance in life satisfaction beyond measures of emotional distress, ($\Delta R^2 = .20, \beta = -$</p>

Author Year Research Design Setting (country)	Demographics and Injury Characteristics of Sample	Validity	Reliability	Responsiveness Interpretability
		<p>– Anxiety subscale and ADAPSS subscales: Fearful despondency: .649 Overwhelming disbelief: .597 Determined resolve: .347 Growth and resilience: .187 Negative perceptions of disability: .496 Personal agency: .393 all $P < .01$</p> <p>The six ADAPSS factors were unrelated to current age and cause of SCI. However, respondents who were unemployed were more likely to endorse items on Fearful Despondency ($z = -2.851$, $P < .01$, two-tailed), Overwhelming</p>	<p>good internal reliability at Time 1 and test-retest ($\alpha > .70$).</p> <p>Spearman's rho correlations for ADAPSS subscales between time 1 and time 2: Fearful despondency: .879 Overwhelming disbelief: .863 Determined resolve: .755 Growth and resilience: .828 Negative perceptions of disability: .814 Personal agency: .615 All $P < .01$</p>	

Author Year Research Design Setting (country)	Demographics and Injury Characteristics of Sample	Validity	Reliability	Responsiveness Interpretability
		<p>Disbelief ($z=-3.473$, $P<.001$, two-tailed), and Negative Perceptions of Disability ($z=-3.231$, $P<.001$, two-tailed). Unemployed respondents were also less likely to endorse items on Determined Resolve ($z=-2.911$, $P<.01$, two-tailed). There was a significant difference between level of injury and scores on Determined Resolve and Negative Perceptions of Disability. The mean scores suggested respondents with a cervical injury were less likely to endorse Determined Resolve items and more likely to endorse Negative Perceptions of</p>		

Author Year Research Design Setting (country)	Demographics and Injury Characteristics of Sample	Validity	Reliability	Responsiveness Interpretability
		<p>Disability items. Female respondents also appeared more likely to endorse Overwhelming Disbelief items. There was a weak significant positive correlation between age at time of injury and Negative Perceptions of Disability, suggesting respondents who endorsed items on this subscale were older when they were injured. A weak significant negative correlation between time since injury and Overwhelming Disbelief suggested respondents who endorsed items on this subscale had been injured for less time.</p>		

Author Year Research Design Setting (country)	Demographics and Injury Characteristics of Sample	Validity	Reliability	Responsiveness Interpretability
		<p>Spearman's rho correlations between the Appraisal of Life Events (ALE) subscales (threat, loss, challenge) and the ADAPSS subscales: See table 1.</p> <p>All six ADAPSS subscales were significantly positively correlated with measures of threat and loss appraisals and significantly negatively correlated with perceived manageability and challenge appraisals. This suggests respondents who were more likely to endorse items on the Fearful Despondency, Overwhelming Disbelief, and</p>		

Author Year Research Design Setting (country)	Demographics and Injury Characteristics of Sample	Validity	Reliability	Responsiveness Interpretability
		<p>Negative Perceptions of Disability subscales were more likely to appraise their injury in terms of loss and threat and to perceive their injury as unmanageable. They were also less likely to appraise their injury in terms of challenge. Respondents who were less likely to endorse items on the Fighting-Spirit, Growth and Resilience, and Personal Agency subscales were more likely to appraise their injury in terms of loss and threat and to perceive their injury as unmanageable. They too were less likely to appraise their injury in terms of challenge.</p>
