

**Research Summary – American Spinal Injury Association Impairment Scale (AIS): International Standards for Neurological Classification of Spinal Cord Injury (ISNCSCI) – Neurological Impairment**

<b>Author Year Country Research Design Setting</b>	<b>Demographics and Injury Characteristics of Sample</b>	<b>Validity</b>	<b>Reliability</b>	<b>Responsiveness Interpretability</b>
<p><a href="#">Lena et al.</a>, 2021</p> <p>Prospective, observational study</p> <p>3 Italian rehabilitation hospitals</p>	<p>N=140 non-traumatic SCI, 92M, 48F</p> <p>Mean age: 60 ±16 years (range 15–86)</p> <p>Level: Cervical: 30 Thoracic: 78 Lumbar: 32</p> <p>AIS A: 32 AIS B: 11 AIS C: 33 AIS D: 64</p>	<p>The correlation between the SCIM self-care subscore and the upper extremity motor score (UEMS) was fair, although significant (<math>r=0.407</math>; <math>p&lt;0.001</math>). The correlations between the lower extremity motor score (LEMS) and the SCIM mobility subscore and between the total MS and the total SCIM score were moderate and significant (<math>r=0.666</math> and <math>r=0.683</math> respectively; <math>p&lt;0.001</math>). The correlations improved by considering persons with tetraplegia and paraplegia separately, dividing the assessment at</p>	<p>Inter-rater reliability gave excellent results for MSs (<math>r=0.965</math>; <math>p&lt;0.001</math>); the correlation for sensory scores was lower, but still excellent (<math>r=0.905</math> for light-touch and 0.902 for pin-prick; <math>p&lt;0.001</math>). Cronbach’s alpha highlighted an excellent internal consistency of the ISNCSCI. The comparison of the data of the two examiners did not show any significant difference</p>	

Author Year Country Research Design Setting	Demographics and Injury Characteristics of Sample	Validity	Reliability	Responsiveness Interpretability
		admission from one at follow-up and dividing incomplete and complete lesions.		
<a href="#">Marino et al.</a> 2020  Longitudinal cohort study  5 spinal cord injury model system centers	N=51 acute traumatic SCI, 44M, 7W  Tetraplegia: 25 Paraplegia T1-T9: 17 Paraplegia T10-T12: 9  AIS A: 29 AIS B: 9 AIS C: 13		Test-retest reliability was almost perfect for all sacral sparing and alternative sacral sparing components. Reliability was perfect (kappa = 1.0) for DAP, VAC and VHTC and almost perfect (kappa = 0.96) for S3P, where only 1/49 exams differed. In the case that differed, exams were performed by different examiners.	
<a href="#">Chun et al.</a> 2020  Prospective, single blinded study  AIR unit	N=40, 22M, 18F  Mean age: 33y (18-83y)  Traumatic: 21 Nontraumatic: 19	Agreement between S-A-ISNCSCI results and I-A-ISNCSCI responses was good for S4-S5 sensation to LT ( $k=0.71$ , 95% CI 0.52-0.90, $N=36$ ), PP ( $k=0.68$ , 95% CI 0.48-0.87, $N=38$ ), and DAP		

<b>Author Year</b> <b>Country</b> <b>Research Design</b> <b>Setting</b>	<b>Demographics and Injury Characteristics of Sample</b>	<b>Validity</b>	<b>Reliability</b>	<b>Responsiveness Interpretability</b>
	Tetraplegia: 14 Paraplegia: 26  AIS A: 11 AIS B: 3 AIS C: 7 AIS D: 19	( $k=0.77$ , 95% CI 0.53–1.00, $N=37$ ); but only poor for VAC with insufficient statistical significance ( $k=0.29$ , 95% CI -0.01 to 0.59, $N=36$ )  Agreement was also good for the identification of overall injury completeness vs. incompleteness based on all ISNCSCI sacral sensory criteria combined ( $k=0.72$ , 95% CI 0.47–0.97, $N=40$ )
